Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid (Art. 99(1) European patent convention).

Description

The present invention relates to an integrally fabricated textile fabric having a layer of hydrophobic yarn, a layer of ground yarns and a layer of hydrophilic yarn being intermeshed with at least one of the other for
 5 integrating said layers and to a method of warp knitting such a fabric.

In the fabrication of various products ranging from athletic wear and other similar apparel items such as active wear and sportswear to such diverse items as diapers, incontinence garments, bed pads, chair pads and various other articles, it is desirable that the article have a high affinity for liquid absorption without producing an uncomfortably wet feel at the exposed liquid-receiving surface of the article. Traditional
 10 athletic garments and other active wear may be provided with a fleece or pile surface facing the wearer's body and be fabricated of cotton for this purpose. Conventional diapers, incontinence garments and pads, and like articles provide one or more relatively thick layers of a highly absorbent material, e.g., non-woven cotton batting, with a non-absorbent yet liquid-permeable barrier covering the liquid-receiving surface of the absorbent material. One common type of barrier is a surface-brushed polyester textile fabric. The layer or
 15 layers of batting or other absorbent material and the barrier are separately fabricated and subsequently attached together in a separate stitching or similar procedure. A liquid impervious backing is typically attached to cover the surface of the absorbent material opposite the barrier to prevent leakage of absorbed liquid.

Liquid absorbing articles of the aforementioned type generally perform acceptably for their intended purpose, but nevertheless suffer certain disadvantages. Athletic garments and active wear generally have
 20 relatively good absorbent qualities but nevertheless produce a wet feel when any significant amount of liquid is absorbed. With diapers and incontinence garments and pads, as mentioned, a relatively thick layer of the absorbent material must generally be utilized to provide an acceptable capacity for liquid absorption. Further, the necessity of attaching a separately fabricated barrier to the absorbent material increases the
 25 overall expense of fabrication of such articles.

Further, from JP-A 60 155 760 a fabric is known having generally separate hydrophilic and hydrophobic yarn layers. In use of the known fabric, the hydrophilic layer is intended for initial liquid contact (e.g., in body contact to absorb sweat). In the known fabric, the hydrophilic layer serves to transmit absorbed moisture to the hydrophobic layer for evaporation. To promote such evaporation, the hydrophobic layer is of
 30 a relatively open work construction providing open spaces which occupy 10 to 80 percent of the surface area of the hydrophobic layer. Further, the fabric's ground yarns should be elastic and formed in a construction rendering the fabric stretchable in both lengthwise and widthwise directions.

It is an object of the present invention to provide an integrally fabricated textile fabric having a liquid permeable non-absorbent layer at one face of the fabric and a liquid retaining absorbent layer at the
 35 opposite face of the fabric by which liquid applied to the non-absorbent layer is wicked to and retained by the absorbent layer so that the non-absorbent layer is maintained essentially dry to the touch, whereby various embodiments of the fabric are suitable for a wide variety of end uses.

This object is achieved by the features of claim 1.

In preferred embodiments of the present textile fabric, a spun yarn of staple natural fibers, e.g., cotton, is utilized as the hydrophilic yarn. Optimal absorbency is achieved by utilizing a spun yarn consisting
 40 entirely of cotton fibers. The hydrophobic yarn is preferably a multifilament synthetic yarn, e.g., polyester. The ground yarn may be a multifilament synthetic yarn, a spun yarn of synthetic fibers, a spun yarn of a blend of synthetic and natural fibers, or a spun yarn of entirely natural fibers.

Preferably, the hydrophilic yarn is of a relatively low yarn count as measured according to the cotton
 45 count system, i.e., of a relatively high denier, which should be substantially higher than the denier of the hydrophobic and ground yarns, preferably more than twice the denier of the hydrophobic yarn. In preferred embodiments of the present fabric, the yarn count of the hydrophilic yarn is less than approximately ten.

Thus, the hydrophilic yarn should constitute in excess of at least approximately forty percent by weight of the fabric. In certain embodiments of the present fabric, the hydrophilic yarn constitutes greater than
 50 forty-five percent by weight of the fabric and in other embodiments exceeds fifty percent by weight of the fabric. The hydrophobic yarn, on the other hand, should constitute no greater than approximately forty percent of the fabric weight. The ground yarn should constitute no greater than approximately thirty percent of the fabric weight and, in certain embodiments, constitutes less than ten percent of the fabric weight.

One preferred construction of the present fabric is by warp knitting the hydrophilic, hydrophobic and
 55 ground yarns in an at least three-bar, but preferably four-bar, construction. A set of hydrophilic yarns are warp knitted in overfed needle loops at the technical face of the fabric for forming the absorbent layer. A set of hydrophobic yarns are warp knitted in extended nappable underlaps at the technical back of the fabric for forming the non-absorbent layer. A first set of ground yarns are warp knitted in a chain stitch pattern and a

second set of ground yarns are warp knitted in a lay-in pattern intermediate the technical face and back of the fabric for restricting its walewise and weftwise stretching.

The needle loops of the hydrophilic yarns are preferably formed in alternate wales and alternate courses of the fabric, with the hydrophilic yarns being anchored intermediate successive needle loops at a weftwise spacing therefrom for increasing the quantity of the hydrophilic yarns in the absorbent fabric layer. Each hydrophobic yarn is warp knitted intermediate each underlap in needle loops formed alternately in the alternate wales and in intermediate wales therebetween. The chain stitches of the first ground yarns are formed in the intermediate wales while the second ground yarns are laid in weftwise between spaced ones of the intermediate wales. In one preferred construction of the fabric, the hydrophilic yarns are knitted in a 5-4, 7-7, 4-5, 2-2 stitch pattern, the hydrophobic yarns are knitted in a 1-0, 3-4 stitch pattern, the first ground yarns are knitted in a 0-1, 1-0 stitch pattern, and the second ground yarns are knitted in a 5-5, 0-0 lay-in pattern.

It is a further object of the present invention to provide a method by which a warp knitted embodiment of such textile fabric may be produced. This object is achieved by the features of claim 24.

After formation of the fabric in the manner according to claim 24, the underlaps of the hydrophobic yarn at the technical back of the fabric are napped sufficiently to substantially reduce the size of the interstices in the non-absorbent layer of the hydrophobic yarns for resisting leakage of absorbed liquid from the absorbent layer of the hydrophilic yarns through the non-absorbent layer of the hydrophobic yarns. Preferably, the warp knitting machine includes a second middle guide bar by which a second set of ground yarns may be laid in non-stitch loops extending about spaced ones of the intermediate needles to form the fabric in a four-bar construction, the two sets of ground yarns providing dimensional stability to the fabric.

Brief Description of the Drawings

Figure 1 is a diagram showing individually the stitch pattern for the hydrophilic, hydrophobic and ground yarns carried out by a warp knitting machine in knitting one preferred embodiment of the present fabric according to the method of the present invention; and

Figure 2 is a schematic cross-sectional view of the present fabric.

Description of the Preferred Embodiment

As explained more fully herein, the preferred embodiment of the fabric of the present invention is produced, and the method of the present invention is carried out, on a warp knitting machine which may be of any conventional type of an at least three-bar construction having three or more yarn guide bars and a needle bar, e.g., a conventional tricot warp knitting machine. A four-bar warp knitting machine adapted for producing dual-faced terry toweling is preferred. One such machine is manufactured and sold by Karl Mayer Textilmaschinenfabrik GmbH, of Obertshausen, West Germany, as its Model KS4-FBZ. Another suitable warp knitting machine is manufactured by Textima of Karl-Marx-Stadt, East Germany, under the model designation Lirapol. The construction and operation of such machines are well known in the warp knitting art and need not herein be specifically described and illustrated. While the fabric of the present invention is herein illustrated and described in its preferred embodiment as a warp knitted fabric, those persons skilled in the textile fabric-producing arts will recognize that equivalent fabrics may be produced as well by weaving or circular (weft) knitting. The description and illustration herein of the preferred warp knitted embodiment of the present fabric is provided merely for illustrative purposes to provide to those persons skilled in the art an enabling disclosure of the presently contemplated best mode of producing the fabric of this invention. It is accordingly to be understood that the present invention is not to be limited to the particular embodiments herein described and illustrated.

In the following description, the yarn guide bars of the warp knitting machine are identified as "top," "middle" and "bottom" guide bars for reference purposes only and not by way of limitation. As those persons skilled in the art will understand, such terms equally identify knitting machines whose guide bars may be referred to as "front," "middle" and "back" guide bars, which machines, of course, are not to be excluded from the scope and substance of the present invention. As further used herein, the "bar construction" of a warp knitting machine refers to the number of yarn guide bars of the machine, while the "bar construction" of a warp knitted fabric refers to the number of different sets of warp yarns included in the fabric, all as is conventional terminology in the art.

Referring now to the accompanying drawings, one particular embodiment of the present textile fabric is illustrated as preferably warp knitted of a four-bar construction on a four-bar warp knitting machine according to the present method. According to this embodiment of the present fabric, the bottom guide bar

of the machine is threaded on alternate guide members with a set of hydrophilic yarns 10 delivered from a warp beam (not shown), the top guide bar is similarly threaded on alternate guide members with a set of hydrophobic yarns 12 delivered from another warp beam (also not shown), the upper middle guide bar is threaded on alternate guide members with a first set of ground yarns 14 supplied from a third warp beam (also not shown), and the lower middle guide bar is threaded on alternate guide members with a second set of ground yarns 16 supplied from a fourth warp beam (also not shown).

It is contemplated that substantially any yarn having an affinity to retain water or another liquid by absorption or otherwise may be utilized as the hydrophilic yarn. In view of the widely recognized capacity of natural cotton fibers for water and liquid absorbency and further in view of the ready commercial availability of yarns spun in whole or in part of cotton fibers in a variety of yarn counts, cotton-containing spun yarns, particularly those consisting entirely of cotton fibers, are considered preferable, although those persons skilled in the art will recognize that other natural fiber yarns may function equally well.

As is well known, substantially all man-made synthetic yarns are lacking in any significant affinity for water or liquid retention and therefore are contemplated to be suitable for use as the hydrophobic yarn. It is of course preferred that the synthetic yarn selected for use as the hydrophobic yarn not be subjected to any finishing operation designed to enhance its liquid retention capability. Further, the synthetic hydrophobic yarn should have the ability to be napped by a conventional textile napping operation without destroying the structural integrity of the yarn. To provide these properties, it is preferred that a multifilament polyester yarn be utilized as the hydrophobic yarn.

Substantially any suitable conventional yarn of sufficient strength to provide structural integrity to the warp knitted fabric may be utilized as the ground yarns. For example, a spun cotton yarn or a spun yarn of cotton and synthetic fibers or a multifilament synthetic yarn may be utilized as the ground yarns. The same or different yarns may be utilized for the two sets of ground yarns.

To provide optimal liquid retaining capabilities to the fabric, it is preferred that the hydrophilic yarns constitute at least approximately forty percent of the weight of the fabric. As described more fully herein, the hydrophilic yarn may constitute in excess of forty-five percent of the fabric weight in certain embodiments and in excess of fifty percent of the fabric weight in other embodiments. The hydrophobic yarns should constitute no greater than approximately forty percent of the fabric weight, with the ground yarns supplying the balance of the fabric weight but preferably no greater than approximately thirty percent thereof. For these purposes, the hydrophilic yarn should be of a relatively low yarn count as measured according to the cotton count system (i.e., of a relatively high denier), which in each embodiment should be of a substantially higher denier than the hydrophobic and ground yarns, preferably at least twice the denier of the hydrophobic yarns. Spun cotton yarns of a yarn count of less than approximately ten are preferred.

In accompanying Fig. 1, the stitch constructions of the hydrophilic, ground and hydrophobic yarns 10, 12, 14, 16, as carried out by the respective lateral traversing movements of the guide bars of the knitting machine according to one possible embodiment of the present fabric and method, are illustrated individually in a traditional dot or point diagram format, wherein the individual points 15 represent the needles of the needle bar of the knitting machine in the formation of several successive fabric courses C across several successive fabric wales W. As aforementioned, the Model KS4-FBZ warp knitting machine manufactured by Karl Mayer Textilmaschinenfabrik GmbH is preferred for use in producing the present fabric and performing the present method. This warp knitting machine is equipped with a longitudinal needle bar to which is mounted a longitudinally extending series of hook-type knitting needles, the hooks of alternating ones of the needles being of a substantially conventional construction defining an open yarn-receiving area within the hook while the hooks of the intervening needles define substantially smaller yarn-receiving areas so that the yarn engaging surface in each such hook is spaced farther from the outer free end of the hook than in the alternating conventional needles. This needle construction enables larger pile-type loops to be formed by the intervening needles. This needle format is described and illustrated in U.S. patent No. 4,397,160. In the illustrations of Fig. 1, the columns of points 15 representing the alternating conventional needles are indicated at 15A, while the columns of the points 15 representing the intervening needles with filled-in hooks are indicated at 15B.

In the illustrated embodiment of the present fabric, the bottom guide bar of the machine manipulates the hydrophilic yarns 10 to traverse laterally back and forth relative to the needle bar of the machine to stitch the hydrophilic yarns 10 on the intervening needles 15B in a repeating 5-4, 7-7, 4-5, 2-2 stitch pattern, as indicated at I of Fig. 1, while the hydrophilic yarns 10 are being fed from their respective warp beam in a conventional overfeeding fashion. Simultaneously, the top guide bar of the machine manipulates the hydrophobic yarns 12 as they are fed from their respective warp beam to traverse relative to the needle bar to stitch the hydrophobic yarns 12 in a repeating 1-0, 3-4 stitch pattern alternatingly on the needles 15A and 15B, as indicated at IV of Fig. 1. At the same time, the upper middle guide bar of the machine manipulates

the first set of ground yarns 14 as they are fed from their respective warp beam to traverse relative to the needle bar to stitch the ground yarns 14 on the alternating needles 15A in a repeating 0-1, 1-0 chain stitch pattern, as indicated at III in Fig. 1. The lower middle guide bar simultaneously manipulates the second set of ground yarns 16 as they are fed from their respective warp beam to traverse relative to the needle bar to lay in the ground yarns 16 about spaced ones of the alternating needles 15A in a repeating 5-5, 0-0, non-stitch lay-in pattern, as indicated at II of Fig. 1.

As will thus be understood, the hydrophilic yarns 10 are interknitted with the hydrophobic yarns 12 which, in turn, are interknitted with the ground yarns 14, the ground yarns 16 being captured between the hydrophilic and ground yarns 10,14, thereby integrating the yarns in the fabric. The overfed stitch construction of the hydrophilic yarns forms the hydrophilic yarns 10 in needle loops 10n formed in alternating courses C1 and in alternating wales W1, each hydrophilic yarn 10 having its needle loops 10n formed in the alternating courses C1 and in a common wale W1 with an underlap extent 10u extending and being anchored between the successive needles loops 10n in the intervening courses C2 at a weftwise spacing from the common wale W1, thereby increasing the quantity of the hydrophilic yarn 10 in the fabric. The ground yarns 14 are formed only in the intervening wales W2, each ground yarn 14 being formed in one respective wale W2 in needle loops 14n aligned walewise with one another in every course C. The hydrophobic yarns 12 are formed in needle loops 12n formed in every alternate wale W1 in every alternate course C1 and in every intervening wale W2 in every intervening course C2, each hydrophobic yarn 12 having its needle loops 12n alternating every course between wales W1,W2 spaced apart by two intervening wales W1,W2 and in elongated underlaps 12u extending diagonally between the successive needle loops 12n in a substantially coursewise direction. In this manner, the needle loops 12n in the alternating wales W1 are interknitted in plated relationship with the overfed needle loops 10n of the hydrophilic yarn 10 in such wales and the needle loops 12n in the intervening wales W2 are interknitted with the needle loops 14n of the ground yarn 14 in such wales. By the aforementioned lay-in pattern of the ground yarns 16, the ground yarns 16 are not directly interknitted with the other yarns 10,12,14, but instead are captured and retained between the hydrophilic yarns 10 and the ground yarns 14 with each ground yarn 16 extending substantially weftwise in every course across five wales including three successive ones of the intervening wales W2 and the two successive alternate wales W1 therebetween.

In this fashion, the hydrophilic yarns 10 are structured in a terry pile construction predominantly at the technical face of the fabric whereat the needle loops 10n of the hydrophilic yarns 10 extend generally outwardly of the fabric surface, thereby forming a relatively thick and relatively dense absorbent outer layer A at the technical face of the fabric, as indicated in Fig. 2. The hydrophobic yarns 12 are formed predominantly at the technical back of the fabric whereat the extended underlaps 12u of the hydrophobic yarns 12 provide a nappable surface, thereby forming an outer non-absorbent layer N of the fabric at its opposite face from the absorbent layer A of hydrophobic yarns 10. The ground yarns 14,16 form a base or substrate G to the fabric predominantly between the absorbent hydrophilic yarn layer A and the non-absorbent hydrophobic yarn layer N for integrating the absorbent and non-absorbent layers and providing dimensional stability to the fabric, the walewise chain stitch construction of the ground yarns 14 restricting the walewise stretchability of the fabric while the coursewise laid-in construction of the ground yarns 16 similarly restricting the coursewise stretchability of the fabric.

Following the knitting of the present warp knitted fabric according to the present method as described, the underlaps 12u at the outer surface of the hydrophobic yarn layer are subjected to a brushing, sanding, napping or similar operation, herein broadly referred to as "napping," to produce a raised velvet-like plush surface effect at the technical back of the fabric, thereby increasing the thickness of the hydrophobic yarn layer and substantially closing or at least reducing in size the interstices formed by the stitch construction of the hydrophobic yarns 12. Fig. 2 schematically illustrates in cross-section the layered construction of the fabric as described.

In use, the fabric of the present invention as described provides a unique and advantageous combination of properties in that the layer of the hydrophilic yarns 10 offers a relatively high capacity for liquid absorption while the non-absorbent layer of the hydrophobic yarns 12 maintains its outer surface substantially dry to the touch. Specifically, the raised nap of the underlaps 12u of the hydrophobic yarns 12 serve to direct liquid coming in contact with the non-absorbent hydrophobic fabric layer N by a wicking action through such layer and through the ground layer G to the absorbent hydrophilic yarn layer A for absorption while, at the same time, the relatively small interstices between the napped filaments of the hydrophobic yarns 12 serve to resist leakage or other return flow of any absorbed liquid from the absorbent hydrophilic yarn layer A through the non-absorbent hydrophobic yarn layer N. As a result, the plush napped hydrophobic yarn layer N remains essentially dry to the touch and comfortable even after the absorbent hydrophilic yarn layer A has absorbed and retains a relatively high liquid content. At the same time, the

fabric is of a relatively small thickness in relation to its capacity for liquid absorbency, particularly as compared to conventional multi-layer absorbent battings of the like aforescribed. As such, the fabric of the present invention is particularly adapted for use in such textile products as diapers, incontinence garments, bed and chair pads, and the like wherein a relatively high capacity for liquid absorbency is desired without the liquid-receiving surface acquiring a correspondingly wetted feel. Similarly, it is contemplated that other embodiments of the present fabric would be highly suited for various apparel items, such as athletic garments, active wear and sportswear.

As those persons skilled in the art will recognize from the foregoing disclosure, the desirable properties of the fabric of the present invention, such as the overall weight of the fabric per unit area (square yard), the percentage content by weight of the hydrophilic, hydrophobic and ground yarns, and the attendant capacity of the fabric for moisture absorbency, may be selectively modified and varied, as desired, by selection of the particular types and sizes of the constituent yarns, thereby to achieve differing embodiments of the fabric suited to differing end uses. By way of example and without limitation, the following are representative examples of fabrics according to the present invention. In each fabric, the respective stitch patterns of the hydrophilic, hydrophobic and ground yarns are as above-described.

Example XIV

	<u>Bar</u>	<u>Yarn</u>	<u>Denier</u> <u>(Cotton Count)</u>	<u>Yarn Ends</u> <u>/Guide</u>	<u>% Weight</u>
30	Bottom (I)	Spun 50% Polyester/ 50% Cotton	759/1 (7/1)	1	40.15
35	Lower Middle (II)	Spun 50% Polyester/ 50% Cotton	332/1 (16/1)	1	23.95
40	Upper Middle (III)	Multi Filament Polyester	70/34	1	4.38
45	Top (IV)	Multi Filament Texturized Polyester	168/68	2	31.52

It will also be recognized by those persons skilled in the art that the particular stitch patterns in which the hydrophilic, hydrophobic and ground yarns are knitted may also be varied provided that the ground
 50 yarns are knitted or formed about needles other than the needles which form the overfed pile needle loops of the hydrophilic yarns and provided that the stitch construction of the hydrophobic yarn provides for knitting of needle loops on both sets of needles to achieve proper integration of the respective yarns in the fabric. Likewise, it is contemplated that embodiments of the present fabric may be of a three-bar rather than four-bar construction requiring only three sets of yarns, namely a set of hydrophilic yarns, a set of
 55 hydrophobic yarns, and only one set of ground yarns. For example, the fabric of Fig. 1 could be constructed without the ground yarns 16 and with the ground yarns 14 knitted in a non-chain stitch construction, such as 1-0, 2-3.

It will therefore be readily understood by those persons skilled in the art that the present invention is susceptible of a broad utility and application. Many embodiments and adaptations of the present invention other than those herein described, as well as many variations, modifications and equivalent arrangements will be apparent from or reasonably suggested by the present invention and the foregoing description thereof, without departing from the substance or scope of the present invention. Accordingly, while the present invention has been described herein in detail in relation to its preferred embodiment, it is to be understood that this disclosure is only illustrative and exemplary of the present invention and is made merely for purposes of providing a full and enabling disclosure of the invention. The foregoing disclosure is not intended or to be construed to limit the present invention or otherwise to exclude any such other embodiments, adaptations, variations, modifications and equivalent arrangements, the present invention being limited only by the claims appended hereto and the equivalents thereof.

Claims

1. An integrally fabricated textile fabric having a layer (N) of hydrophobic yarn (12), a layer (G) of ground yarns (14, 16) and a layer (A) of hydrophilic yarn (10) being intermeshed with at least one of the other for integrating said layers, characterized by a liquid permeable non-absorbent layer (N) of hydrophobic yarn (12) formed in a raised surface construction predominantly at one face of said fabric adapted for initial liquid contact in use of said fabric,
a liquid retaining absorbent layer (A) of hydrophilic yarn (10) formed in a relatively dense extended pile construction predominantly at the opposite face of said fabric for wicking of liquid from said non-absorbent layer (N) to, and retention of wicked liquid by, said absorbent layer (A),
and a layer (G) of generally inelastic yarn (14, 16) formed in a dimensionally stable generally non-stretchable construction predominantly between said faces of said fabric,
said raised surface construction of hydrophobic yarn (12) being produced by napping to substantially reduce the size of interstices in said non-absorbent layer (N) to permit liquid permeation therethrough to said absorbent layer (A) while serving to resist leakage of absorbed liquid from said absorbent layer (A) through said non-absorbent layer (N).
2. The textile fabric according to claim 1 and characterized further in that said hydrophilic yarn (10) is a spun yarn of staple natural fibers.
3. The textile fabric according to claim 2 and characterized further in that said natural fibers are cotton.
4. The textile fabric according to claim 3 and characterized further in that said spun yarn (10) consists entirely of cotton fibers.
5. The textile fabric according to claim 1 and characterized further in that said hydrophobic yarn (12) comprises a multifilament synthetic yarn.
6. The textile fabric according to claim 5 and characterized further in that said filaments of said synthetic yarn (12) are polyester.
7. The textile fabric according to claim 1 and characterized further in that said ground yarn (14, 16) comprises at least one of synthetic fibers and filaments and natural fibers.
8. The textile fabric according to claim 1 and characterized further in that said hydrophilic yarn (10) is of a relatively low yarn count according to the cotton count system.
9. The textile fabric according to claim 8 and characterized further in that said hydrophilic yarn (10) is of a yarn count of less than approximately 10.
10. The textile fabric according to claim 8 and characterized further in that said hydrophilic yarn (10) is of a substantially higher denier than said hydrophobic and ground yarns (12; 14, 16).
11. The textile fabric according to claim 10 and characterized further in that said hydrophilic yarn (10) is of a denier in excess of at least approximately twice the denier of said hydrophobic yarn (12).

12. The textile fabric according to claim 8 and characterized further in that said hydrophilic yarn (10) comprises in excess of at least approximately 40 percent by weight of said fabric.
13. The textile fabric according to claim 12 and characterized further in that said hydrophilic yarn (10) comprises in excess of approximately 45 percent by weight of said fabric.
14. The textile fabric according to claim 13 and characterized further in that said hydrophilic yarn (10) comprises in excess of approximately 50 percent by weight of said fabric.
15. The textile fabric according to claim 12 and characterized further in that said hydrophobic yarn (12) comprises no greater than approximately 40 percent by weight of said fabric.
16. The textile fabric according to claim 15 and characterized further in that said ground yarn (14, 16) comprises no greater than approximately 30 percent by weight of said fabric.
17. The textile fabric according to claim 1 and characterized further in that said fabric is warp knitted of an at least three-bar construction.
18. The textile fabric according to claim 17 and characterized further in that said hydrophilic yarn (10) comprises a set of yarns warp knitted in overfed needle loops at the technical face of said fabric for forming said absorbent layer (A).
19. The textile fabric according to claim 18 and characterized further in that said hydrophilic yarns (10) are anchored intermediate successive needle loops (10n) at a weftwise spacing therefrom for increased quantity of said hydrophilic yarns in said absorbent layer (A) of said fabric.
20. The textile fabric according to claim 18 and characterized further in that said hydrophobic yarn (12) comprises a set of yarns warp knitted in extended nappable underlaps at the technical back of said fabric for forming said non-absorbent layer (N).
21. The textile fabric according to claim 20 and characterized further in that said fabric is of a four-bar construction, said ground yarn including a first set of yarns (14) warp knitted in a chain stitch pattern and a second set of yarns (16) warp knitted in a lay-in pattern for restricting walewise and weftwise stretching of said fabric.
22. The textile fabric according to claim 21 and characterized further in that said needle loops (10n) of said hydrophilic yarns (10) are formed in alternate wales (W1) and alternate courses (C1) of said fabric, each said hydrophobic yarn (12) is warp knitted intermediate each said underlap in needle loops (12n) formed alternately in said alternate wales (W1) and in intermediate wales (W2) therebetween, and said first ground yarns (14) are formed in said intermediate wales (W2).
23. The textile fabric according to claim 21 and characterized further in that said hydrophilic yarns (10) are warp knitted in a 5-4, 7-7, 4-5, 2-2 stitch pattern, said hydrophobic yarns (12) are warp knitted in a 1-0, 3-4 stitch pattern, said first ground yarns (14) are warp knitted in a 0-1, 1-0 stitch pattern, and said second ground yarns (16) are warp knitted in a 5-5, 0-0 lay-in pattern.
24. A method of producing a warp knitted textile fabric of an at least three-bar construction having a liquid permeable non-absorbent layer (N) at the technical back of said fabric and a liquid retaining absorbent layer (A) at the technical face of said fabric, said method comprising:
 - providing a warp knitting machine having at least top, middle and bottom yarn guide bars and a needle bar supporting a series of needles;
 - warp knitting a set of hydrophilic yarns (10) on said bottom guide bar in overfed needle loops (10n) on selected needles of said needle bar forming an absorbent layer (A) of said hydrophilic yarn needle loops in a relatively dense pile construction at the technical face of said fabric;
 - simultaneously warp knitting a set of hydrophobic yarns (12) on said top guide bar in needle loops alternately on said selected needles and on intermediate needles therebetween and in elongated nappable underlaps extending between said hydrophobic yarn (12) needle loops (12n) forming a non-absorbent layer (N) of said hydrophobic yarns (12) at the technical back of said fabric;

simultaneously warp knitting a set of ground yarns (14, 16) on said middle guide bar in needle loops on said intermediate needles forming a layer of said ground yarn essentially intermediate said absorbent pile layer (A) of said hydrophilic yarn (10) and said non-absorbent layer (N) of said hydrophobic yarn (12); and

- 5 napping said nappable underlaps of said hydrophobic yarn (12) sufficiently to substantially reduce the size of interstices in said non-absorbent layer (N) of said hydrophobic yarns (12) for resisting leakage of absorbed liquid from said absorbent layer (A) of said hydrophilic yarns (10) through said non-absorbent layer (N) of said hydrophobic yarns (12).
- 10 25. A method of producing a warp knitted textile fabric according to claim 24 and characterized further by providing spun yarns of staple natural fibers as said hydrophilic yarns (10).
26. A method of producing a warp knitted textile fabric according to claim 25 and characterized further by providing spun yarns of cotton as said hydrophilic yarns (10).
- 15 27. A method of producing a warp knitted textile fabric according to claim 26 and characterized further by providing spun yarns consisting entirely of cotton fibers as said hydrophilic yarns (10).
28. A method of producing a warp knitted textile fabric according to claim 24 and characterized further by providing multifilament synthetic yarns as said hydrophobic yarns (12).
- 20 29. A method of producing a warp knitted textile fabric according to claim 28 and characterized further by providing multifilament yarns of polyester filaments as said hydrophobic yarns (12).
- 25 30. A method of producing a warp knitted textile fabric according to claim 1 and characterized further by providing yarns comprising at least one of synthetic fibers and filaments and natural fibers as said ground yarn (14, 16).
- 30 31. A method of producing a warp knitted textile fabric according to claim 1 and characterized further by providing yarns having a relatively low yarn count according to the cotton count system as said hydrophilic yarns (10).
32. A method of producing a warp knitted textile fabric according to claim 31 and characterized further by providing yarns having a yarn count of less than approximately 10 as said hydrophilic yarns (10).
- 35 33. A method of producing a warp knitted textile fabric according to claim 31 and characterized further by providing, as said hydrophilic yarns (10), yarns having a substantially higher denier than said hydrophobic and ground yarns (12; 14, 16).
- 40 34. A method of producing a warp knitted textile fabric according to claim 33 and characterized further by providing, as said hydrophilic yarns (10), yarns of a denier in excess of at least approximately twice the denier of said hydrophobic yarns (12).
35. A method of producing a warp knitted textile fabric according to claim 31 and characterized further by providing said hydrophilic yarns (10) in sufficient quantity to comprise in excess of approximately 40 percent by weight of said fabric.
- 45 36. A method of producing a warp knitted textile fabric according to claim 31 and characterized further by providing said hydrophilic yarns (10) in sufficient quantity to comprise in excess of approximately 45 percent by weight of said fabric.
- 50 37. A method of producing a warp knitted textile fabric according to claim 31 and characterized further by providing said hydrophilic yarns (10) in sufficient quantity to comprise in excess of approximately 50 percent by weight of said fabric.
- 55 38. A method of producing a warp knitted textile fabric according to claim 35 and characterized further by providing said hydrophobic yarns (12) in appropriate quantity to comprise no greater than approximately 40 percent by weight of said fabric.

39. A method of producing a warp knitted textile fabric according to claim 38 and characterized further by providing said ground yarns (14, 16) in appropriate quantity to comprise no greater than approximately 30 percent by weight of said fabric.
- 5 40. A method of producing a warp knitted textile fabric according to claim 24 and characterized further in that said warp knitting said hydrophilic yarns (10) includes anchoring said hydrophilic yarns intermediate successive needle loops (10n) at a weftwise spacing therefrom for increased quantity of said hydrophilic yarns (10) in said absorbent layer (A) of said fabric.
- 10 41. A method of producing a warp knitted textile fabric according to claim 24 and characterized further in that said fabric is of a four-bar construction and said providing said warp knitting machine includes providing a second middle guide bar, and characterized further by laying-in on said second guide bar a second set of ground yarns (16) in non-stitch loops extending about said intermediate needles.
- 15 42. A method of producing a warp knitted textile fabric according to claim 41 and characterized further by warp knitting said hydrophilic yarns (10) in a 5-4, 7-7, 4-5, 2-2 stitch pattern, warp knitting said hydrophobic yarns (12) in a 1-0, 3-4 stitch pattern, warp knitting said first-mentioned ground yarns (14) in a 0-1, 1-0 stitch pattern, and warp knitting said second ground yarns (16) in a 5-5, 0-0 lay-in pattern.

20 Patentansprüche

1. Integral hergestelltes textiles Erzeugnis mit einer Schicht (N) aus hydrophobem Garn (12), einer Schicht (G) aus Grundgarnen (14, 16) und einer Schicht (A) aus hydrophilem Garn (10), das zur Integration der Schichten mit wenigstens einem der anderen vermascht ist, gekennzeichnet durch
- 25 eine flüssigkeitsdurchlässige, nicht, aufsaugende Schicht (N) aus hydrophobem Garn (12), die in einem Aufbau mit erhabener Oberfläche vorwiegend auf einer Seite des Erzeugnisses ausgebildet und für einen ersten Kontakt mit Flüssigkeit bei einer Verwendung des Erzeugnisses ausgelegt ist,
- eine flüssigkeitsrückhaltende, aufsaugende Schicht (A) aus hydrophilem Garn (10), die in einem Aufbau mit relativ dichtem, langgestrecktem Flor vorwiegend auf der entgegengesetzten Seite des Erzeugnisses ausgebildet ist, um eine Dochtwirkung für Flüssigkeit von der nicht aufsaugenden Schicht (N) zu
- 30 der aufsaugenden Schicht (A) auszuüben und durch Dochtwirkung aufgesaugte Flüssigkeit dort zurückzuhalten,
- und eine Schicht (G) aus im allgemeinen inelastischem Garn (14, 16), die in einem formbeständigen, im allgemeinen nicht dehnbaren Aufbau vorwiegend zwischen den Seiten des Erzeugnisses ausgebildet ist,
- 35 wobei der Aufbau mit erhabener Oberfläche aus hydrophobem Garn (12) durch Aufrauen erzeugt wird, um die Abmessung von Lücken in der nicht aufsaugenden Schicht (N) wesentlich zu reduzieren und so zu erlauben, daß Flüssigkeit durch dieselbe hindurch zu der aufsaugenden Schicht (A) gelangt, während sie dazu dient, einem Entweichen von aufgesaugter Flüssigkeit aus der aufsaugenden Schicht
- 40 (A) durch die nicht aufsaugende Schicht (N) hindurch Widerstand entgegenzusetzen.
2. Textiles Erzeugnis nach Anspruch 1 und weiter dadurch gekennzeichnet, daß das hydrophile Garn (10) ein Gespinnst aus Stapelnaturfasern ist.
- 45 3. Textiles Erzeugnis nach Anspruch 2 und weiter dadurch gekennzeichnet, daß die Naturfasern aus Baumwolle bestehen.
4. Textiles Erzeugnis nach Anspruch 3 und weiter dadurch gekennzeichnet, daß das Gespinnst (10) vollständig aus Baumwollfasern besteht.
- 50 5. Textiles Erzeugnis nach Anspruch 1 und weiter dadurch gekennzeichnet, daß das hydrophobe Garn (12) ein synthetisches Multifilamentgarn beinhaltet.
6. Textiles Erzeugnis nach Anspruch 5 und weiter dadurch gekennzeichnet, daß die Filamente des synthetischen Garns (12) aus Polyester bestehen.
- 55 7. Textiles Erzeugnis nach Anspruch 1 und weiter dadurch gekennzeichnet, daß das Grundgarn (14, 16) wenigstens eines von synthetischen Fasern und Filamenten und Naturfasern beinhaltet.

8. Textiles Erzeugnis nach Anspruch 1 und weiter dadurch gekennzeichnet, daß das hydrophile Garn (10) eine relativ niedrige Garnnummer gemäß dem Baumwollgarnnummernsystem aufweist.
9. Textiles Erzeugnis nach Anspruch 8 und weiter dadurch gekennzeichnet, daß das hydrophile Garn (10) eine Garnnummer von weniger als ungefähr 10 aufweist.
10. Textiles Erzeugnis nach Anspruch 8 und weiter dadurch gekennzeichnet, daß das hydrophile Garn (10) ein wesentlich höheres Denier als die hydrophoben und die Grundgarne (12; 14, 16) aufweist.
11. Textiles Erzeugnis nach Anspruch 10 und weiter dadurch gekennzeichnet, daß das hydrophile Garn (10) ein Denier von mehr als wenigstens ungefähr dem Doppelten des Deniers des hydrophoben Garns (12) aufweist.
12. Textiles Erzeugnis nach Anspruch 8 und weiter dadurch gekennzeichnet, daß das hydrophile Garn (10) mehr als wenigstens ungefähr 40 Gewichtsprozent des Erzeugnisses ausmacht.
13. Textiles Erzeugnis nach Anspruch 12 und weiter dadurch gekennzeichnet, daß das hydrophile Garn (10) mehr als ungefähr 45 Gewichtsprozent des Erzeugnisses ausmacht.
14. Textiles Erzeugnis nach Anspruch 13 und weiter dadurch gekennzeichnet, daß das hydrophile Garn (10) mehr als ungefähr 50 Gewichtsprozent des Erzeugnisses ausmacht.
15. Textiles Erzeugnis nach Anspruch 12 und weiter dadurch gekennzeichnet, daß das hydrophobe Garn (12) nicht mehr als ungefähr 40 Gewichtsprozent des Erzeugnisses ausmacht.
16. Textiles Erzeugnis nach Anspruch 15 und weiter dadurch gekennzeichnet, daß das Grundgarn (14, 16) nicht mehr als ungefähr 30 Gewichtsprozent des Erzeugnisses ausmacht.
17. Textiles Erzeugnis nach Anspruch 1 und weiter dadurch gekennzeichnet, daß das Erzeugnis mit einem Aufbau von wenigstens drei Leisten kettengewirkt ist.
18. Textiles Erzeugnis nach Anspruch 17 und weiter dadurch gekennzeichnet, daß das hydrophile Garn (10) einen Satz von in Voreilfadenschlingen kettengewirkten Garnen an der technischen Vorderseite des Erzeugnisses beinhaltet, um die aufsaugende Schicht (A) zu bilden.
19. Textiles Erzeugnis nach Anspruch 18 und weiter dadurch gekennzeichnet, daß die hydrophilen Garne (10) zwischen aufeinanderfolgenden Fadenschlingen (10n) in einem Schußrichtungsabstand von denselben zwecks erhöhter Quantität an hydrophilen Garnen in der aufsaugenden Schicht (A) des Erzeugnisses verankert sind.
20. Textiles Erzeugnis nach Anspruch 18 und weiter dadurch gekennzeichnet, daß das hydrophobe Garn (12) einen Satz von in ausgedehnten, aufrauhbaren Unterpelzlagen kettengewirkten Garnen an der technischen Rückseite des Erzeugnisses beinhaltet, um die nicht aufsaugende Schicht (N) zu bilden.
21. Textiles Erzeugnis nach Anspruch 20 und weiter dadurch gekennzeichnet, daß das Erzeugnis einen Vierleisten-Aufbau aufweist, wobei das Grundgarn einen ersten Satz von in einem Kettenmaschenmuster kettengewirkten Garnen (14) und einen zweiten Satz von in einem Einlagemuster kettengewirkten Garnen (16) beinhaltet, um ein Dehnen in Rippenrichtung und in Schußrichtung des Erzeugnisses einzuschränken.
22. Textiles Erzeugnis nach Anspruch 21 und weiter dadurch gekennzeichnet, daß Fadenschlingen (10n) der hydrophilen Garne (10) in alternierenden Rippen (W1) und alternierenden Maschenreihen (C1) des Erzeugnisses gebildet sind, wobei jedes hydrophobe Garn (12) zwischen jeder Unterpelzlage in Fadenschlingen (12n) kettengewirkt ist, die alternierend in den alternierenden Rippen (W1) und in dazwischenliegenden Rippen (W2) gebildet sind, und daß die ersten Grundgarne (14) in den zwischenliegenden Rippen (W2) gebildet sind.

23. Textiles Erzeugnis nach Anspruch 21 und weiter dadurch gekennzeichnet, daß die hydrophilen Garne (10) in einem 5-4-, 7-7-, 4-5-, 2-2-Maschenmuster kettengewirkt sind, die hydrophoben Garne (12) in einem 1-0-, 3-4-Maschenmuster kettengewirkt sind, die ersten Grundgarne (14) in einem 0-1-, 1-0-Maschenmuster kettengewirkt sind und die zweiten Grundgarne (16) in einem 5-5-, 0-0-Einlagemuster kettengewirkt sind.
24. Verfahren zur Herstellung eines kettengewirkten textilen Erzeugnisses mit einem Aufbau mit wenigstens drei Leisten, das eine flüssigkeitsdurchlässige, nicht aufsaugende Schicht (N) an der technischen Rückseite des Erzeugnisses und eine flüssigkeitsrückhaltende, aufsaugende Schicht (A) an der technischen Vorderseite des Erzeugnisses aufweist, wobei das Verfahren folgendes umfaßt:
- Bereitstellen einer Kettenwirkmaschine mit wenigstens einer oberen, einer mittleren und einer unteren Garnführungsleiste und einer Nadelleiste, die eine Nadelreihe trägt;
- Kettenwirken eines Satzes von hydrophilen Garnen (10) auf der unteren Führungsleiste in Voreilfädenschlingen (10n) auf ausgewählten Nadeln der Nadelleiste, wobei eine aufsaugende Schicht (A) aus den Fadenschlingen aus hydrophilem Garn in einem Aufbau mit relativ dichtem Flor an der technischen Vorderseite des Erzeugnisses gebildet wird;
- gleichzeitiges Kettenwirken eines Satzes von hydrophoben Garnen (12) auf der oberen Führungsleiste in Nadelschlingen abwechselnd auf ausgewählten Nadeln und auf dazwischenliegenden Nadeln und in langgestreckten, aufrauhbaren Unterpelzlagen, die sich zwischen den Nadelschlingen (12n) aus hydrophobem Garn (12) erstrecken, wobei eine nicht aufsaugende Schicht (N) aus wasserabweisenden Garnen (12) an der technischen Rückseite des Erzeugnisses gebildet wird;
- gleichzeitiges Kettenwirken eines Satzes von Grundgarnen (14,16) auf der mittleren Führungsleiste in Nadelschlingen auf den dazwischenliegenden Nadeln, wobei eine Schicht aus dem Grundgarn im wesentlichen zwischen der aufsaugenden Florschicht (A) aus dem hydrophilen Garn (10) und der nicht aufsaugenden Schicht (N) aus dem hydrophoben Garn (12) gebildet wird; und
- Aufrauhn der aufrauhbaren Unterpelzlagen aus dem hydrophoben Garn (12) in ausreichender Weise, um die Abmessung von Lücken in der nicht aufsaugenden Schicht (N) aus den hydrophoben Garnen (12) wesentlich zu reduzieren, um einem Entweichen von aufgesaugter Flüssigkeit aus der aufsaugenden Schicht (A) aus den hydrophilen Garnen (10) durch die nicht aufsaugende Schicht (N) aus den hydrophoben Garnen (12) hindurch Widerstand entgegenzusetzen.
25. Verfahren zur Herstellung eines kettengewirkten textilen Erzeugnisses nach Anspruch 24 und weiter gekennzeichnet durch ein Bereitstellen von Gespinsten aus Stapelnaturfasern als den hydrophilen Garnen (10).
26. Verfahren zur Herstellung eines kettengewirkten textilen Erzeugnisses nach Anspruch 25 und weiter gekennzeichnet durch ein Bereitstellen von Gespinsten aus Baumwolle als den hydrophilen Garnen (10).
27. Verfahren zur Herstellung eines kettengewirkten textilen Erzeugnisses nach Anspruch 26 und weiter gekennzeichnet durch ein Bereitstellen von Gespinsten, die gänzlich aus Baumwollfasern als den hydrophilen Garnen (10) bestehen.
28. Verfahren zur Herstellung eines kettengewirkten textilen Erzeugnisses nach Anspruch 24 und weiter gekennzeichnet durch ein Bereitstellen von synthetischen Multifilamentgarnen als den hydrophoben Garnen (12).
29. Verfahren zur Herstellung eines kettengewirkten textilen Erzeugnisses nach Anspruch 28 und weiter gekennzeichnet durch ein Bereitstellen von Multifilamentgarnen aus Polyester-Filamenten als den hydrophoben Garnen (12).
30. Verfahren zur Herstellung eines kettengewirkten textilen Erzeugnisses nach Anspruch 1 und weiter gekennzeichnet durch ein Bereitstellen von Garnen, die wenigstens eine von synthetischen Fasern und Filamenten und Naturfasern als das Grundgarn (14, 16) beinhalten.
31. Verfahren zur Herstellung eines kettengewirkten textilen Erzeugnisses nach Anspruch 1 und weiter gekennzeichnet durch ein Bereitstellen von Garnen mit einer relativ niedrigen Garnnummer gemäß dem Baumwollgarnnummernsystem als den hydrophilen Garnen (10).

32. Verfahren zur Herstellung eines kettengewirkten textilen Erzeugnisses nach Anspruch 31 und weiter gekennzeichnet durch ein Bereitstellen von Garnen mit einer Garnnummer von weniger als ungefähr 10 als den hydrophilen Garnen (10).
- 5 33. Verfahren zur Herstellung eines kettengewirkten textilen Erzeugnisses nach Anspruch 31 und weiter gekennzeichnet durch ein Bereitstellen von Garnen als den hydrophilen Garnen (10), die ein wesentlich höheres Denier als die hydrophoben und die Grundgarne (12; 14, 16) aufweisen.
- 10 34. Verfahren zur Herstellung eines kettengewirkten textilen Erzeugnisses nach Anspruch 33 und weiter gekennzeichnet durch ein Bereitstellen von Garnen als den hydrophilen Garnen (10) mit einem Denier von mehr als wenigstens ungefähr dem Doppelten des Deniers der hydrophoben Garne (12).
35. Verfahren zur Herstellung eines kettengewirkten textilen Erzeugnisses nach Anspruch 31 und weiter gekennzeichnet durch ein Bereitstellen der hydrophilen Garne (10) in ausreichender Menge, um mehr
15 als ungefähr 40 Gewichtsprozent des Erzeugnisses auszumachen.
36. Verfahren zur Herstellung eines kettengewirkten textilen Erzeugnisses nach Anspruch 31 und weiter gekennzeichnet durch ein Bereitstellen der hydrophilen Garne (10) in ausreichender Menge, um mehr
20 als ungefähr 45 Gewichtsprozent des Erzeugnisses auszumachen.
37. Verfahren zur Herstellung eines kettengewirkten textilen Erzeugnisses nach Anspruch 31 und weiter gekennzeichnet durch ein Bereitstellen der hydrophilen Garne (10) in ausreichender Menge, um mehr als ungefähr 50 Gewichtsprozent des Erzeugnisses auszumachen.
- 25 38. Verfahren zur Herstellung eines kettengewirkten textilen Erzeugnisses nach Anspruch 35 und weiter gekennzeichnet durch ein Bereitstellen der hydrophoben Garne (12) in geeigneter Menge, um nicht mehr als ungefähr 40 Gewichtsprozent des Erzeugnisses auszumachen.
- 30 39. Verfahren zur Herstellung eines kettengewirkten textilen- Erzeugnisses nach Anspruch 38 und weiter gekennzeichnet durch ein Bereitstellen der Grundgarne (14, 16) in geeigneter Menge, um nicht mehr als ungefähr 30 Gewichtsprozent des Erzeugnisses auszumachen.
40. Verfahren zur Herstellung eines kettengewirkten textilen Erzeugnisses nach Anspruch 24 und weiter dadurch gekennzeichnet, daß das Kettenwirken der hydrophilen Garne (10) das Verankern der hydro-
35 philen Garne zwischen aufeinanderfolgenden Fadenschlingen (10n) in einem Schußrichtungsabstand von denselben zwecks erhöhter Quantität der hydrophilen Garne (10) in der aufsaugenden Schicht (A) des Erzeugnisses beinhaltet.
41. Verfahren zur Herstellung eines kettengewirkten textilen Erzeugnisses nach Anspruch 24 und weiter
40 dadurch gekennzeichnet, daß das Erzeugnis einen Vierleisten-Aufbau aufweist und das Bereitstellen der Kettenwirkmaschine das Bereitstellen einer zweiten mittleren Führungsleiste beinhaltet, und weiter gekennzeichnet durch das Einlegen eines zweiten Satzes von Grundgarnen (16) in Nichtmaschen-
Schlingen, die sich um die dazwischenliegenden Nadeln herum erstrecken, auf die zweite Führungslei-
45 ste.
42. Verfahren zur Herstellung eines kettengewirkten textilen Erzeugnisses nach Anspruch 41 und weiter gekennzeichnet durch ein Kettenwirken der hydrophilen Garne (10) in einem 5-4-, 7-7-, 4-5-, 2-2-
Maschenmuster, ein Kettenwirken der hydrophoben Garne (12) in einem 1-0-, 3-4-Maschenmuster, ein
50 Kettenwirken der ersterwähnten Grundgarne (14) in einem 0-1-, 1-0-Maschenmuster und ein Kettenwir-
ken der zweiten Grundgarne (16) in Kettstuhlgewebe in einem 5-5-, 0-0-Einlagemuster.

Revendications

1. Toile textile ayant une couche (N) de fils hydrophobes (12), une couche (G) de fils de fond (14, 16) et
55 une couche (A) de fils hydrophiles (10), mailées au moins l'une avec l'autre pour intégrer lesdites
couches caractérisée par
une couche non absorbante (N) de fils hydrophobes perméable aux liquides (12) formée dans la
surface saillante et répartie d'une manière prédominante sur une face de ladite toile pour un contact

- initial avec un liquide en cours d'usage,
une couche absorbante (A) de fils hydrophiles de retenue du liquide (10) formée dans un empilage relativement dense prédominant sur la face opposée de ladite toile pour l'étoupage du liquide à partir de ladite couche non absorbante (N) et pour retenir le liquide étoupe par ladite couche absorbante (A),
5 et une couche (G) de fils (14, 16) généralement non élastiques tissés selon une construction non tendue prédominante entre les faces de ladite toile,
ladite surface saillante de fils hydrophobes (12) étant produite par grattage pour réduire substantiellement la taille des interstices dans ladite couche non absorbante (N) pour permettre le passage du liquide à travers elle, vers ladite couche absorbante (A) en servant de résistance aux fuites du liquide
10 absorbé de ladite couche absorbante (A) à travers ladite couche non absorbante (N).
2. La toile textile selon la revendication 1, caractérisée de plus en ce que lesdits fils hydrophiles (10) consistent en des fils câblés d'une broche de fibres naturelles.
 - 15 3. La toile textile selon la revendication 2, caractérisée de plus en ce que les fibres naturelles sont du coton.
 4. La toile textile selon la revendication 3, caractérisée de plus en ce que lesdits fils câblés (10) consistent entièrement en fibres de coton.
 - 20 5. La toile textile selon la revendication 1, caractérisée de plus en ce que les fils hydrophobes (12) comprennent des fils synthétiques multifilaments.
 6. La toile textile selon la revendication 5, caractérisée de plus en ce que lesdits fils synthétiques multifilaments (12) sont en polyester.
 - 25 7. La toile textile selon la revendication 1, caractérisée de plus en ce que les fils de fond (14, 16) comprennent au moins des fibres synthétiques, des fibres multifilaments et des fibres naturelles.
 - 30 8. La toile textile selon la revendication 1, caractérisée de plus en ce que lesdits fils hydrophiles (10) sont des fibres à titre relativement bas selon le système de titrage du coton.
 9. La toile textile selon la revendication 8, caractérisée de plus en ce que lesdits fils hydrophiles (10) sont d'un titre de fil d'environ moins de 10.
 - 35 10. La toile textile selon la revendication 8, caractérisée de plus en ce que lesdits fils hydrophiles (10) sont d'un titre en deniers sensiblement plus grand que les fils hydrophobes et de fond (12, 14, 16).
 11. La toile textile selon la revendication 10, caractérisée de plus en ce que lesdits fils hydrophiles (10) sont d'un titre en denier supérieur à au moins approximativement deux fois le titre des fils hydrophobes (12).
 - 40 12. La toile textile selon la revendication 8, caractérisée de plus en ce que lesdits fils hydrophiles (10) composent au moins 40 pourcent du poids de ladite toile.
 - 45 13. La toile textile selon la revendication 12, caractérisée de plus en ce que lesdits fils hydrophiles (10) composent au moins 45 pourcent du poids de ladite toile.
 14. La toile textile selon la revendication 13, caractérisée de plus en ce que lesdits fils hydrophiles (10) composent au moins 50 pourcent du poids de ladite toile.
 - 50 15. La toile textile selon la revendication 12, caractérisée de plus en ce que lesdits fils hydrophobes (12) composent moins d'environ 40 pourcent du poids de ladite toile.
 - 55 16. La toile textile selon la revendication 15, caractérisée de plus en ce que lesdits fils de fond (14, 16) composent moins de 30 pourcent du poids de ladite toile.

17. La toile textile selon la revendication 1, caractérisée de plus en ce que ladite toile est tricotée sur un métier à au moins trois barres.
18. La toile textile selon la revendication 17, caractérisée de plus en ce que lesdits fils hydrophiles (10) comprennent un ensemble de fils tricotés par des boucles à aiguilles suralimentées à la surface technique de ladite toile pour former ladite couche absorbante (A).
19. La toile textile selon la revendication 18, caractérisée de plus en ce que lesdits fils hydrophiles (10) sont amenées dans des boucles successives (10n) espacées l'une de l'autre pour une quantité accrue desdits fils hydrophiles dans ladite couche absorbante (A) de ladite toile.
20. La toile textile selon la revendication 18, caractérisée de plus en ce que lesdits fils hydrophobes (12) comprennent un ensemble de fils de chaîne tricotés en chevauchement en nappes sur le dos technique de ladite toile pour former ladite couche (N) non-absorbante.
21. La toile textile selon la revendication 20, caractérisée de plus en ce que ladite toile est fabriquée sur une métier à quatre barres lesdits fils de fond incluant un premier ensemble de fils de chaîne tricotés au point de chaînette et un second ensemble de fils de chaîne (16) tricotés au point noué pour réduire la tension des côtes et de la trame de ladite toile.
22. La toile textile selon la revendication 21, caractérisée de plus en ce que lesdites boucles d'aiguilles (10n) des fils hydrophiles (10) sont formés par des côtes alternées (W1) et des courses alternées (C1) de ladite toile, les fils hydrophobes (12) étant tricotés en chaîne entre chaque recouvrement en boucles d'aiguilles (12n) formées alternativement dans les côtes alternées (W1) et dans les côtes intermédiaires (W2), les premiers fils de fond (14) étant formés dans les côtes intermédiaires (W2).
23. La toile textile selon la revendication 21, caractérisée de plus en ce que lesdits fils hydrophiles sont tricotés selon une figure de points 5-4, 7-7, 4-5, 2-2, les fils hydrophobes (12) étant tricotés selon la figure de points 1-0, 3-4, les premiers fils de fond (14) étant tricotés en 0-1, 1-0 et les seconds fils de fond (16) étant tricotés en 5-5, 0-0.
24. Procédé de fabrication d'une toile textile tricotée en chaîne sur un métier à au moins trois barres ayant une couche perméable au liquide non absorbante (N) au dos technique de ladite toile et une couche absorbante (A) de retenue du liquide dans la face avant de ladite toile comprenant les étapes suivantes :
 - équipement avec une machine de tricotage présentant au moins des barres-guide en haut, au milieu et en bas, une fonture d'aiguilles supportant une pluralité d'aiguilles ;
 - tricotage d'un ensemble de fils (10) hydrophiles sur ladite barre guide du bas en suralimentant les boucles d'aiguilles (10n) sur des aiguilles sélectionnés de ladite barre d'aiguilles pour former la couche absorbante (A) des boucles de fils hydrophiles dans une construction relativement dense dans la face technique avant de ladite toile ;
 - simultanément, tricotage d'une ensemble de fils hydrophobes (12) sur ladite barre supérieure en boucles d'aiguilles alternées sur des aiguilles intermédiaires, en recouvrements inférieur s'étendant entre les boucles (12n) de fils hydrophobes (12) pour former une couche non absorbante (N) au dos technique de ladite toile ;
 - simultanément, tricotage d'une ensemble de fils (14, 16) sur ladite barre du milieu de fils (14, 16) en boucles d'aiguilles sur lesdites aiguilles intermédiaires formant une couche de fond entre la couche absorbante (A) des fils hydrophiles (10) et la couche non absorbante (N) des fils hydrophobes (12) ;
 - grattage desdits recouvrements desdits fils hydrophobes (12) pour réduire notablement la taille des interstices dans ladite couche non absorbante (N) des fils hydrophobes (12) pour résister aux fuites du liquide absorbé par ladite couche absorbante (A) des fils hydrophiles (10) à travers la couche non absorbante des fils hydrophiles (12).
25. Procédé de fabrication d'une toile textile tricotée en chaîne selon la revendication 24, caractérisé de plus en ce que les fils hydrophiles (10) sont alimentés sous la forme câblés de fibres naturelles.
26. Procédé de fabrication d'une toile textile tricotée en chaîne selon la revendication 25, caractérisé de plus en ce que les fils hydrophiles (10) sont des fibres de coton.

27. Procédé de fabrication d'une toile textile tricotée en chaîne selon la revendication 26, caractérisé de plus en ce que les fils hydrophiles (10) sont entièrement constitués par des fibres de coton.
28. Procédé de fabrication d'une toile textile tricotée en chaîne selon la revendication 24, caractérisé de plus en ce que les fils hydrophobes (12) sont constitués par des fils synthétiques multifilaments.
29. Procédé de fabrication d'une toile textile tricotée en chaîne selon la revendication 28, caractérisé de plus en ce que les fils hydrophobes (12) sont formés de fils multifilaments de polyester.
30. Procédé de fabrication d'une toile textile tricotée en chaîne selon la revendication 1, caractérisé de plus en ce que les fils de fond (14, 16) sont formés fibres et de filaments synthétiques et de fibres naturelles.
31. Procédé de fabrication d'une toile textile tricotée en chaîne selon la revendication 1, caractérisé de plus en ce que les fils hydrophiles (10) sont formés sous forme de fils ayant un titre relativement bas dans le système de titrage du coton.
32. Procédé de fabrication d'une toile textile tricotée en chaîne selon la revendication 31, caractérisé de plus en ce que les fils hydrophiles (10) ont un titre inférieur à dix.
33. Procédé de fabrication d'une toile textile tricotée en chaîne selon la revendication 31, caractérisé de plus en ce que les fils hydrophiles (10) ont un titre en denier très supérieur à celui des fils hydrophobes (12) et de fond (14, 16).
34. Procédé de fabrication d'une toile textile tricotée en chaîne selon la revendication 33, caractérisé de plus en ce que lesdits fils hydrophiles (10) ont un titre en deniers égal à au moins deux fois le titre des fils hydrophobes (12).
35. Procédé de fabrication d'une toile textile tricotée en chaîne selon la revendication 31, caractérisé de plus en ce que les fils hydrophiles (10) sont alimentés en quantité suffisante pour constituer au moins 40 pourcent en poids de ladite toile.
36. Procédé de fabrication d'une toile textile tricotée en chaîne selon la revendication 31, caractérisé de plus en ce que les fils hydrophiles (10) constituent au moins 45 pourcent en poids de ladite toile.
37. Procédé de fabrication d'une toile textile tricotée en chaîne selon la revendication 31, caractérisé de plus en ce que les fils hydrophiles (10) constituent au moins 50 pourcent en poids de ladite toile.
38. Procédé de fabrication d'une toile textile tricotée en chaîne selon la revendication 35, caractérisé de plus en ce que lesdits fils hydrophobes (12) constituent moins de 40 pourcent en poids de ladite toile.
39. Procédé de fabrication d'une toile textile tricotée en chaîne selon la revendication 38, caractérisé de plus en ce que lesdits fils hydrophobes (12) constituent moins de 30 pourcent en poids de ladite toile.
40. Procédé de fabrication d'une toile textile tricotée en chaîne selon la revendication 24, caractérisé de plus en ce que le tricotage en chaîne des fils hydrophiles (10) inclut l'ancrage des fils hydrophiles dans des boucles d'aiguilles intermédiaires successives à un espacement ouvert pour accroître la quantité desdits fils hydrophiles (10) dans la couche absorbante (A) de la toile.
41. Procédé de fabrication d'une toile textile tricotée en chaîne selon la revendication 21, caractérisé de plus en ce que la toile est tricotée sur un métier à quatre barres incluant une seconde barre de milieu, et caractérisé de plus par recouvrement de ladite seconde barre par un second ensemble de fils de fond (16) en boucles s'étendant autour des aiguilles intermédiaires.
42. Procédé de fabrication d'une toile textile tricotée en chaîne selon la revendication 41, caractérisé de plus en ce que les fils hydrophiles (10) sont tricotés en chaîne selon une configuration 5-4, 7-7, 4-5, 2-2, les fils (12) hydrophobes selon une configuration 1-0, 3-4 les premiers fils (14) de fond selon 0-1, 1-0 et les seconds fils de fond (16) en 5-5, 0-0.
